

HealthPathways is going mobile-friendly

From 3rd November, Auckland Regional HealthPathways will become [mobile-friendly](#).

The new version is easier to use and looks great, whether you are accessing it from your phone, tablet, or desktop.

Although the look and functionality are improved, the information is exactly the same as on the existing HealthPathways site, and the usual username and password will continue to work.

Find out more about the new mobile-friendly platform [here](#).

[Start using the mobile-friendly platform now.](#)

New Website Address (Domain name)

As a part of this update, Auckland Regional HealthPathways will have a new website address. If you access HealthPathways via a saved bookmark in your browser or a shortcut on your desktop, please update these to the new web address:

<https://aucklandregion.communityhealthpathways.org>

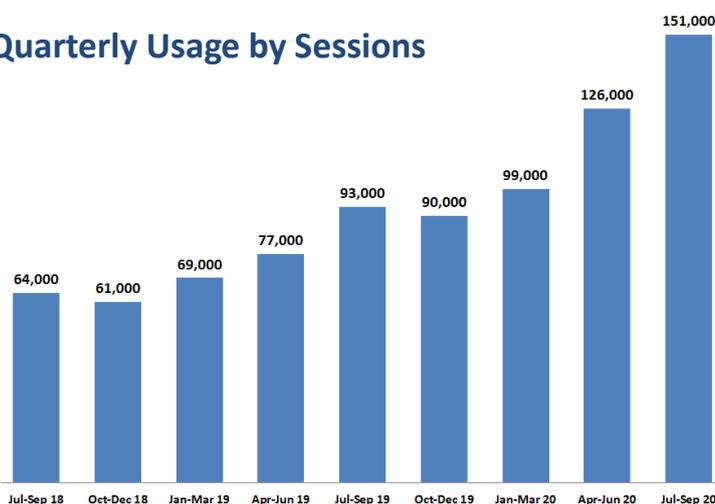

You may be prompted to re-enter the username and password details when accessing from the new website address for the first time.

Accessing HealthPathways

You can access HealthPathways through practice management systems including: MedTech, Patient Dashboard, MyPractice and Mōhio. To find out how, see **Shortcuts and Bookmarks** on the [How to Use HealthPathways](#) page.

If you need assistance with accessing HealthPathways or with a direct link, [contact us](#) or your PHO.

Quarterly Usage by Sessions

Check our [Daily Updates](#) regularly for the most up to date information.

COVID-19 suite

Please continue to see our [COVID-19 pages](#) for the latest guidance.

NEW: COVID-19 Telehealth - A new addition to the COVID suite covering all aspects of telehealth, including advice about which patients are more suitable, privacy and regulatory standards, preparing for the consultation, instructions for the patient, suggestions for consent and confidentiality conversations, and tips for taking a history via telehealth.

Recently Localised Pathways

Spinal Cord Impairment (SCI): The full suite of spinal cord impairment (SCI) pathways has been localised, providing detailed guidance for managing many aspects of SCI including pain, bowel management, sexuality, respiratory infection, and spasticity.

Liver Cancer: Most liver lesions are asymptomatic until advanced, so a high level of suspicion is needed in at-risk people, with formal surveillance recommended for patients with cirrhosis and certain patients with hepatitis B. At-risk patients should be treated to optimise liver health, including alcohol abstinence and antiviral treatment for hepatitis B and C where appropriate.

Prostatitis: This pathway covers acute and chronic prostatitis. Note the current recommended antibiotic options (cotrimoxazole or, if contraindicated, norfloxacin) and the advice not to use nitrofurantoin due to subtherapeutic levels in the prostate.

Important Pathway Updates

- [Culturally and Linguistically Diverse \(CALD\) Young People](#)
- [Cellulitis in Adults](#)
